

Chitragupta

Product Overview & Feature Guide

The vision, delivered

One assistant the whole company talks to in plain language — embedded inside ERPNext — that can fetch anything and do anything the person is allowed to, prepares every change for human confirmation, keeps a complete audit record, and measurably learns from every interaction.

It appears on every Desk page after ERP login, knows who you are (your real user and roles, via ERP-signed single sign-on) and what document you're looking at — so “what's the status of this?” just works.

Everything it can do

Capability	What it looks like in use
Ask anything on live data	“Total revenue this month”, “how many POs for Zuckerman?” — counts, sums, comparisons, supplier-wise breakdowns; f
Screen-context Q&A	“Who raised this PO? What's its amount? What files are attached?” — answered from the real open document
Read attachments	Reads quotation PDFs, Excels, CSVs attached to any document and answers from their contents
How-to guidance	“How do I raise a PO?” — real menu paths, aware of the user's actual role
Create documents	Multi-turn gathering (details accumulate), name resolution, DD-MM-YYYY dates normalised, required fields completed, th
Compose multi-step work	“Find all POs still to receive and comment on each”, “change the qty on that draft”, “cancel PUR-ORD-...” — an agent wor
Comments & tagging	Posts to the document timeline, @mentions users
Reports	“Purchase report in Excel” → real .xlsx/.csv/.pdf with a Download button
File upload	Drop a supplier quotation/CSV into the chat as context — e.g. draft a PO from it
Voice	■ dictation (Chrome/Edge), auto-send
Learns	Your edits before approval become norms applied to future drafts; preferences on request; precedents recalled; a measur

Governance — engineered, not promised

- Drafts-first: no write reaches the ERP without explicit human approval (approve-with-edits supported)
- Risk tiers: reads auto · submits/updates/cancels need approval · ledger deletes blocked outright, hard value cap
- Identity: ERP-signed SSO assertions (replay-bounded); per-user session binding verified against the ERP; a mismatched session is never bound
- Defence-in-depth: writes gated in-engine AND by ERPNext's own permission engine
- Read-back verification after every commit; complete audit trail of every step
- A jailbroken model or malicious uploaded file can at most STAGE a proposal — locked by tests

Where it stands in the market

Capability	changAI	ChatNext	Next AI	Definable	Chitragupta
Q&A on live ERP data	Deep	Partial	No	Yes	Yes
Governed actions (draft→approve→submit)	No	No	No	Generic	Yes — proven live
Embedded in Desk, sees the open document	No	No	No	No	Yes — unique
Acts as the real logged-in user	n/a	No	No	No	Yes
Reads document attachments	No	No	No	No	Yes
Learns from human corrections	Schema	Claimed	No	KBs	Yes — measurable
Voice + upload + report downloads	Partial	No	No	No	Yes
Self-host / on-prem	Mostly	No	?	No	Yes

No competitor combines embedded screen context, per-user governed action, attachment reading and measurable learning. Their edge is packaging age; Chitragupta's is category.

By the numbers

Metric	Value
Automated tests (all passing)	131 across 16 suites
Backend	18 Python modules; FastAPI; SQLAlchemy
Verified live	Real POs drafted, approved & submitted on ERPNext with read-back; SSO act-as-user working end-to-end
Channels	In-ERP widget on every Desk page + standalone portal
Self-diagnosis	/api/version build stamp · /api/learning scorecard · live-ERP diagnostic scripts
